报告地点：卢嘉锡二楼会议室（215）

Abstract:

In the Polymer Nanohybrid Materials at Ewha Womans University, a comprehensive approach for the design and synthesis of multifunctional hybrid nanomaterials has been systematically performed to seek their potential applications as key elements in green nano- and bio-technology. Representative subject areas of interest include energy conversion and storage, environmental remediation, optical (bio-)sensing, light-emission, and memory devices. Of the numerous methodologies to achieve these goals, we actively utilize *complementary self-assembly* processes to construct well-defined hybrid nanoscopic objects suitable for target-oriented applications. Recently, we also pay special attention to *surface plasmons* as a versatile platform,^{1,2} based on which target-oriented properties can be obtained by integrating plasmonic nanostructures into the elements of optical (bio-)sensors, photovoltaic devices, photocatalysts, and light-emitting materials. In this talk, I'll introduce our recent activities with a special focus on the synthesis and applications of active nanomaterials for highly selective/sensitive sensing, plasmonic dye-sensitized solar cells, visible light active photocatalysis, and enhanced fluorescence.

Keywords: hybrid carbon, surface plasmon, solar cell, photocatalysis, fluorescence, sensing
